                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              amyloidogenesis and/or amyloid-plaque formation. The antibody molecule may also be used in preparing a diagnostic composition for the detection of the disease mentioned above. The antibody is used for the disintegration of beta-amyloid plaques or for passive immunisation against beta-amyloid plaque formation. In particular, the disease is dementia, Alzheimer's disease, motor neuropathy, Down's syndrome, Creutzfeldt Jacob disease, hereditary cerebral haemorrhage with amyloidosis butch type, Parkinson's disease, HIV-related dementia, amyotrophic lateral sclerosis or neuronal disorders related to aging. The present sequence is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                              CC The invention relates to a novel molecule comprising the antigen binding CC portion of an isolated antibody having a specific binding affinity for a CC receptor protein tyrosine kinase, and which blocks constitutive activation of a receptor protein tyrosine kinase, such as fibroblast CC activation of a receptor 3 (FGFR3). The novel molecules of the invention CC have the following activities: osteopathic, cytostatic, nootropic, CC neuroprotective, ophthalmological, and antidiabetic. The nucleic acids cencoding the novel molecules of the invention can be used in gene therapy to treat disorders. The molecule and nucleic acid molecules are useful CC treating bone and cartilage related disorders such as CC craniosynostosis (e.g. Muenke coronal craniosynostosis or Crouzon CC syndrome with acanthosis nigricans), or skeletal dysplasia (e.g. CC achondroplasia, thanatophoric dysplasia (TD), hypochomroplasia, severe CC achondroplasia with developmental delay and acanthosis nigricans (SADDAN) CC dysplasia), cell proliferative disorders, haematopoietic mallignancy (e.g. multiple myeloma), hyperproliferative disorders, neurovascular glaucoma, CC multiple myeloma), hyperproliferative retinopathy including diabetic retinopathy. This sequence represents an MSPRO antibody light chain CC variable region peptide relating to the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                             fused to the constant domains at least two (poly)peptides having the different receptor or ligand functions, where further at least two of the different receptor or ligand functions, where further at least two of the different receptor or ligand functions, where further at least two of the different receptor or ligand functions, where further at least two of the configuration of the constant domains. The heterominibodies have represented to the configuration of the compounds can be used for diagnosing, preventing and treating malignants of the cell growth related to malignancies of haematopoietic cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, melanomas and sarcomas. The present sequence is the left chain of a theterominibody comprising HD70 single-chain for (sefe) fragment N-terminally linked to human CH1 domain which bears at its C-terminus the human inflammatory cytokine granulocyte/macrophage colony stimulating factor (GM-CSF), plus a hexahistidine sequence for ease of purification. HD70 sefetone for ease of purification collecule (EpCAM) also called 17-1A antigen
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The patent discloses heterominibodies which are multifunctional compounds produceable in a mammalian host cell as a secretable and fully functional heterodimer of two polypeptide chains, where one of the polypeptide chains comprises, a CHI-domain (constant domain of an immunoglobulin heavy chain) and the other chain comprises CL-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Homo
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 antiproliferative; prevention; treatment; malignant; haematopoietic cell;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC chains comprises, a CH1-domain (constant domain of an immunoglobulin CC heavy chain) and the other chain comprises CI-domain (constant domain of an immunoglobulin light chain). The polypeptide chains further comprise, CC fused to the constant domains at least two (poly)peptides having CC different receptor or ligand functions, where further at least two of the CC different (poly)peptides lack an intrinsic affinity for one another and CC are linked via the constant domains. The heterominibodies have CC cytostatic, immunostimulatory, antileukaemia and antiproliferative activities. These compounds can be used for diagnosing, preventing and CC cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, CC cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, CC cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, CC cells e.g. lymphomas and leukaemias, or to solid tumours e.g. carcinomas, CC melanomas and sarcomas. The present sequence is the right chain of a CC terminally linked to human Ck domain (constant domain inflammatory CC cytokine interleukin-2 (IL-2). HD70 scpv specifically recognises the human epithelial cell adhesion molecule (EpCAM) also called 17-1A antigen

```

receptor protein tyrosine kinase of the receptor protein tyrosine

portion of

invention tion of an

relates to a novel isolated antibody,

l molecule comprising t, which has an increase e and which blocks conse kinase. The methods s

comprising the antigen binding an increased affinity for a blocks constitutive activation

compositions

activation

the invention are useful for treating or inhibiting a skeletal dysplasia, craniosynostosis or a cell proliferative disorder. The skeletal dysplasia is achondroplasia, thanatophoric dysplasia, hypochondroplasia, severe achondroplasia with developmental delay or acanthosis nigricans dysplasia. The craniosynostosis disorder is Muenke coronal craniosynostosis or Crouzin syndrome with acanthosis nigricans. The cell proliferative disorder is tumour progression that is progression of translitional cell carcinoma. Osteosarcoma, chondrosarcoma, multiple myeloma or mammary carcinoma. This sequence represents the protein derived from a Fab expression vector relating to the protein tyrosine kinase inhibitor of the invention	the invent craniosyno is achondropl achondropl dysplasia. craniosyno proliferat transition myeloma or derived fr kinase inh	8888888888

RESULT 1 US-09-782-397-14

Sequence 14, Application US/09782397
Publication No. US20030021779A1
GENERAL INFORMATION:

```
APPLICANT: Dan, Michael D.

Maiti, Pradip K.

Kaplan, Howard A.

TITLE OF INVENTION: ANTIGEN BINDING FRAGMENTS H11, THAT

SPECIFICALLY DETECT CANCER CELLS, NUCLECTIDES ENCODING THE
FRAGMENTS, AND USE THEREOF FOR THE PROPHYLAXIS AND
DETECTION OF CANCERS

NUMBER OF SEQUENCES: 28

CORRESPONDENCE ADDRESS:
ADDRESSE: MOTISON & FOOTSTET LLP
STREET: 755 Page Mill Road
CITY: Palo Alto
STATE: CA
COUNTRY: USA
ZIP: 94304-1018
COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk

Sequence 6, Application US/09985442

Patent No. US20020156248A1

GENERAL INFORMATION:
APPLICANT: Filpula, David R.
APPLICANT: Winitlow, Marc D.
APPLICANT: Winitlow, Marc D.
TITLE OF INVENTION: NO. US20020156248A1el Method for Targeted Delivery of Nucleic Aci
PILE REFERENCE: 0977.2300003
CURRENT APPLICATION NUMBER: US/09/985,442

CURRENT APPLICATION NUMBER: 09/420,592
PRIOR APPLICATION NUMBER: 09/420,592
PRIOR APPLICATION NUMBER: 60/104,949
PRIOR FILING DATE: 1999-10-19
PRIOR PILING DATE: 1998-10-20
NUMBER OF SEQ ID NOS: 13
SOFTWARE: Patentin Ver. 2.1
SEQ ID NO 6
LENGTH: 283
TYPE: PRT

GENERAL INFORMATION:

APPLICANT: THE SCRIPPS RESEARCH INSTITUTE

APPLICANT: MAYFIELD, Stephen P.

APPLICANT: FRANKLIN, SCOTT E.

ITILE OF INVENTION: EXPRESSION OF POLYPEPTIDES IN CHLOROPLASTS, AND COMPOSITIONS AND TITLE OF INVENTION: FOR EXPRESSING SAME

FILE REFERENCE: SCRIP1510-2

CURRENT APPLICATION NUMBER: US/10/422,628

CURRENT APPLICATION NUMBER: US 60/375,129

PRIOR APPLICATION NUMBER: US 60/375,129

PRIOR APPLICATION NUMBER: US 60/375,129

PRIOR FILING DATE: 2002-04-23

PRIOR FILING DATE: 2002-10-19

NUMBER OF SEQ ID NOS: 48
